

## USE CASE

# COLLABORATION ACROSS 3 CONTINENTS

**In the fast-moving automotive industry, the ability for employees to collaborate and communicate in real-time is vital. With a constant flow of information generated by tests, assembly lines, and other manufacturing processes, today's automotive professionals have to be able to share, analyse, and co-author content whenever and wherever they want.**

To deliver that capability to a workforce of 120,000 across three continents, this organisation needed a seamless approach to collaboration; one that would both boost productivity and enhance the end-user experience. Moreover, the platform needed to be implemented flawlessly in order to avoid any disruption to its day-to-day manufacturing operations.

With Microsoft 365 the chosen collaboration platform, users needed to be introduced to tools like Teams, OneDrive, SharePoint and more in a short space of time. Computacenter delivered a comprehensive migration and adoption programme to ensure a fast, cost-efficient and successful shift to this new environment. 120,000 accounts were moved, with no errors or interruptions to employee workflows.

For this manufacturer, the close partnership between Computacenter and Microsoft is helping it drive efficiency and productivity, giving employees everywhere the ability to chat, meet, share, and co-create more easily than ever.
